

Customer Churn Analysis Report

By: Suprith S

1. Introduction

Customer churn refers to customers leaving a business over time. Reducing churn is important because retaining customers is more cost-effective than acquiring new ones. This project analyses customer data to understand churn patterns and present insights through interactive dashboards.

2. Objective

The objectives of this project are:

- To analyse customer churn behaviour
- To identify key factors contributing to churn
- To present insights using dashboards for business decision-making

3. Dataset Overview

The dataset contains customer demographics, usage behaviour, financial information, support interactions, and marketing engagement. The target variable is **churn (Yes/No)**.

4. Dashboard Overview

The dashboard consists of **five pages**:

- **Front Cover:** Project overview and key metrics
- **Churn Overview:** Overall churn rate, customer distribution, and contract-based churn
- **Usage & Behaviour Analysis:** Login activity, session time, feature usage, and engagement trends
- **Financial & Support Analysis:** Pricing, payments, support tickets, satisfaction, and marketing impact
- **Final Summary:** Key insights and business recommendations

5. Key Insights

- Month-to-month contracts have the highest churn
- Low engagement and long inactivity increase churn risk
- High monthly fees and payment failures contribute to churn
- Low CSAT and NPS scores are strongly linked to churn

6. Conclusion

This project shows how dashboards can be used to analyse customer churn effectively. The insights help businesses identify high-risk customers and take proactive steps to improve customer retention.
